Agradecimentos

Agradecer às pessoas especiais não é uma tarefa fácil, pois muitas vezes as palavras não conseguem expressar o tamanho da minha gratidão.

Agradeço aos meus pais, Worley e José Carlos, por sempre apoiarem minhas escolhas e por me oferecerem o amor incondicional e o suporte para permitir que o percurso fosse feito da forma mais tranquila possível.

Agradeço ao amor da minha vida, Marina, por tornar mais suave e feliz esse período, que por muitas vezes não foi fácil. Ouvindo meus desabafos e acalentando as minhas aflições e frustrações.

Agradeço a querida orientadora e professora Juliana pela contribuição na minha jornada acadêmica e pessoal. Obrigado pela confiança, paciência, compreensão e carinho.

Agradeço ao Prof. Fabrício por apoiar e incentivar a nossa ideia.

Agradeço ao Prof. Igor e ao Prof. Alfredo pelo suporte ao trabalho e que gentilmente cederam a infraestrutura do seu laboratório para que eu pudesse conduzir parte dos experimentos.

Agradeço à Prof. Rosa e os alunos do seu laboratório pelas constantes colaborações e por me acolherem carinhosamente em seu grupo de pesquisa

Agradeço, em especial, aos meus amigos Danielle, Onésia, Natália, Camila e Marcelo que me acolheram e participaram no desenvolvimento deste estudo, estando sempre à disposição para ajudar e compartilhar ideias.

Agradeço ao Lucas e Estefânia pela disponibilidade em me ensinar e acompanhar ativamente a execução de alguns dos experimentos realizados.

Agradeço aos demais Professores e colegas do NNC pelas oportunidades de integrar o grupo e pela disponibilidade.

Agradeço ao Programa de Pós-Graduação em Fisiologia e Farmacologia, ICB/UFMG, pela chance de realizar esta dissertação.

Ao CNPq e FAPEMIG pelo auxílio financeiro.

Além de todos aqueles que participaram e contribuíram nesta fase da minha vida.

Muito obrigado!

Resumo

A esclerose múltipla é a doença neurologicamente progressiva e incapacitante mais comum entre adultos jovens. A desordem se caracteriza pela ocorrência de desmielinização, inflamação crônica, perda axonal e de oligodendrócitos. A compreensão dos mecanismos imuno-patológicos e possíveis tratamentos é um grande desafio. Para elucidar algumas destas questões o uso de modelos animais, que reproduzem as alterações da doença, representa uma ferramenta útil. Dentre os modelos cita-se a encefalomielite autoimune experimental (EAE) induzida pela imunização com neuroantígenos. O canabidiol (CBD) é o principal componente da *Cannabis sativa*, destituído de efeitos psicoativos. As suas propriedades neuroprotetoras, anti-inflamatórias e antioxidantes já foram documentadas em estudos de diversas desordens. A partir desse cenário, o objetivo da investigação foi avaliar os efeitos do tratamento crônico e profilático com CBD sobre os eventos imunológicos e degenerativos da EAE.

Para tanto, os camundongos C57Bl/6, fêmeas (10-12 semanas, 17-20 gramas), foram divididos em quatro grupos. Os dois primeiros foram submetidos ao EAE, sendo um deles tratado ao longo dos 14 dias de avaliação da doença, com uma dose diária de 5mg/kg da droga por via intra-peritoneal (i.p), e o outro com correspondentes injeções do veículo (Tween 5%). Os demais animais constituíram os controles (sem EAE) que foram divididos, de modo similar, nos grupos CBD e veículo. O modelo foi induzido por injeção subcutânea de uma emulsão contendo 100 μ g MOG₃₅₋₅₅ em PBS 1X e solução de 4mg/ml de *Mycobacterium tuberculosis* H37RA em Adjuvante Completo de Freud, além da administração de pertussis toxina (i.p), 300 ng/200 μ l/animal, em dois momentos diferentes.

Os animais foram monitorados diariamente quanto ao peso corporal e às manifestações clínicas, através de uma escala de escore e periodicamente por teste motor (*Rotarod*) e sensorial (*Tail Flick*). Sendo que o esquema terapêutico aplicado não foi eficaz em reverter a progressão e a gravidade clínica do modelo. No 14º dia pós indução houve a visualização, no cérebro e medula, dos eventos de rolamento e adesão leucocitária através da técnica de microscopia intravital e da integridade da barreira hematoencefálica, pela mensuração do extravasamento do corante azul de Evans. Avaliou-se também, apenas na medula, a expressão por RT-PCR das moléculas de adesão (VCAM-1, ICAM-1) e o infiltrado inflamatório. Em relação a estes parâmetros, o fitocanabinóide atenuou a inflamação central observada no modelo. A determinação indireta nos níveis séricos de óxido nítrico (NO), pela reação de Griess, indicou que o tratamento aumentou a biodisponibilidade desse mediador no EAE, que possivelmente pode ter contribuído para parte dos efeitos citados.

A avaliação *in vitro*, pelo ensaio de redução do MTT, reafirmou a capacidade do CBD de inibir a proliferação das células esplênicas em resposta ao MOG₃₅₋₅₅ por um mecanismo independente de proteína G. Entretanto, a atividade imunossupressora da droga não foi observada *in vivo*, uma vez que o tratamento não reverteu o aumento da contagem global de leucócitos na circulação periférica percebida nos animais EAE.

Considerando os eventos degenerativos característicos do modelo, desmielinização e dano axonal avaliados respectivamente, através da coloração por LFB e pela expressão do neurofilamento-H, a terapia não foi capaz de reverter o decréscimo desses parâmetros.

Em síntese, esse trabalho sugere que o CBD atenuou o processo inflamatório na EAE, interferindo nos vários eventos relacionados à migração leucocitária para o SNC. Entretanto, o canabinoide não alterou os aspectos degenerativos o que refletiu, em parte, na sua ineficácia sobre a clínica do animal.

Abstract

Multiple sclerosis is a progressive and disabling disease neurologically more common among young adults. The disorder is characterized by the occurrence of demyelination, chronic inflammation, axonal and oligodendrocytes loss. Understanding the immuno-pathological mechanisms and possible treatments is a major challenge. To elucidate some of these issues, the use of animal models, that reproduce the disease changes, represent a useful tool. Among the models available, highlights the experimental autoimmune encephalomyelitis (EAE) induced by immunization with neuropeptides. The cannabidiol (CBD) is the main component of Cannabis sativa devoid of psychoactive effects. Its neuroprotective, anti-inflammatory and antioxidants properties have been documented in studies of various disorders. From this scenario, the goal of this investigation was to evaluate the effects of chronic and prophylactic treatment with CBD on immune and degenerative events of EAE.

To reach this aim, C57BL/ 6 female mice (10-12 weeks, 17-20 g) were divided into four groups. Two groups were subjected to EAE model induction, one being treated daily with CBD (5 mg/kg, i.p.) from day 0 to 14 post induction and the second was treated with vehicle (5% Tween). Control groups were divided similarly into vehicle and CBD. The EAE was induced by subcutaneous injection of an emulsion containing 100 μ g MOG 35-55 plus 4mg/ml of Mycobacterium tuberculosis H37Ra in Freud's Complete Adjuvant. Pertussis toxin (300 ng/animal, i.p.) was injected on the day of immunization and 48 h later.

The animals were monitored daily for body weight and clinical manifestations, across a range of scores, and periodically for motor (*Rotarod*) and sensory (Tail Flick) tests. The therapy used was not effective in reversing the progression and severity of the clinical model. On day 14 post induction, there was visualization of leukocyte adhesion and rolling by intravital microscopy technique, and integrity of the blood brain barrier by measuring of Evans blue dye extravasation in the brain and spinal cord. The expression of adhesion molecules (VCAM-1, ICMA-1) was also evaluated, only in the spinal cord, by RT-PCR and the inflammatory cell infiltration. In relation to these parameters, the drug attenuates central inflammation observed in the model. The indirect determination in serum nitric oxide (NO) by Griess reaction, indicated that treatment increased the bioavailability of this mediator in EAE, which possibly may have contributed to some of the effects mentioned.

The in vitro evaluation, by the MTT reduction assay, confirmed the ability of CBD to inhibit proliferation of splenic cells in response to MOG35-55 by a mechanism independent of G protein. However, the immunosuppressive activity of the drug was not observed *in vivo*, since the treatment did not reverse the increased total count of the leukocytes in the peripheral circulation seen in EAE animals.

The therapy, though, was not able to reverse the decline of characteristic degenerative events of the model, demyelination and axonal damage, evaluated respectively by staining for LFB and neurofilament-H expression.

In summary, this study suggests that CBD attenuated the inflammatory process in EAE by interfering in various events related to leukocyte migration into the CNS. Nevertheless, the cannabinoid did not alter the degenerative process which reflects, in part, its clinical inefficacy on the animal model.

Lista de Abreviaturas

µm – micrômetro
µg – micrograma
µl - microlitro
2-AG- 2- aracdonoil-glicerol
2-AGE- 2- aracdonoil-glicerol-eter
5-HT_{1A}- receptor de serotonina
AEA- aracdonoil-etanolamida
AMPc- adenosina monofosfato cíclico
AMT- transportadores de membrana de anadamida
ANOVA - Análise de variância
BHE – Barreira hematoencefálica
CB- canabinóides
CBD- canabidiol
CD- grupamento de diferenciação (*cluster of differentiation*)
CEBIO- Centro de Bioterismo
CETEA - Comitê de Ética em Experimentação Animal
CFA- Complexo adjuvante de Freud
cm- centímetro
CSF – Fluido cerebroespinhal
d.p.i- dias pós indução
DMEM- *Dulbeccos's Modified Medium*
DNA- ácido desoxiribonucleico
cDNA- DNA complementar
EAE - Encefalomielite autoimune experimental
EM- Esclerose múltipla
FAAH: amida hidrolase de ácidos graxo
g - grama
h - horas
H&E – Hematoxilina-eosina
i.p. - Injeção intraperitoneal
i.v. - Injeção intravenosa
ICAM - Molécula de adesão intercelular (*Intercellular adhesion molecule*)
IFN-γ - Interferon gama
Ig- imunoglobulina
IL - Interleucina
iNOS - óxido nítrico sintase induzível
JAMs- moléculas de adesão juncional
LFB - *Luxol fast blue*
LPS - lipopolissacarídeo
M - Molar
MAGL - monoacilglicerol lipase
mg - miligrama
mg/Kg - miligrama por Kilograma
MHC - Complexo principal de histocompatibilidade
min- minuto
mL– mililitro
MOG- glicoproteína da mielina de oligodendrócito

MPB- proteína básica da mielina
MTT- 3-(4,5-dimetil-2-tiazolil)-2,5-difenil-2H-brometo de tetrazolium
NADA- N-aracdonoil-dopamina
Nf- neurofilamento
NF- κB: fator nuclear κB
ng- nanograma
nm- nanômetro
NNC- Núcleo de neurociências
NO - óxido nítrico
